# Trace Elements in Urine Event #1, 2013

Dear Laboratory Director:

Results from the first proficiency test (PT) event for 2013 in the category Trace Elements in Urine have been tabulated and summarized. Target values for Arsenic, Cadmium, Mercury and Lead have been established along with acceptable ranges. Results are graded using element-specific criteria as indicated in each narrative section. A laboratory with an unacceptable significant analytical bias relative to the target value will be expected to investigate the source of the error. A confidential three-digit code number assigned by the PT program identifies participant laboratories.

#### PT Materials

The source of the test materials is human urine obtained from donor volunteers with informed consent. Urine was collected into polyethylene containers and then stored at 4°C. Following collection, urine from each donor was mixed and acidified to 1% v/v with nitric acid, and 1% (v/v) sulfamic acid solution containing 200 mg/mL sulfamic acid and 10% (v/v) Triton-X 100 was added to stabilize Hg. The urine was stored frozen at -80°C; after thawing at room temperature, precipitated salts were removed by centrifugation. The urine was separated into five pools and each was supplemented with different amounts of As, Cd, Hg and Pb as inorganic salts. Each pool was also spiked with additional trace elements that comprise the "NHANES suite" and include: Ba, Be, Co, Cs, Mo, Pt, Sb, Tl, U and W. Each pool was stirred for approximately 24 hours to ensure thorough mixing prior to aliquoting 10-mL samples into acid-leached polypropylene vials. Samples were stored at -80°C prior to circulating for proficiency testing.

The next PT event for trace elements in urine is scheduled to be mailed Wednesday, May 8th, 2013. Please inform our laboratory staff at (518) 474-4484 if the test materials have not arrived within five days of the scheduled mail out date. The deadline for reporting results is Wednesday, June 5th, 2013.

Thank you for your participation.

Sincerely,

Patrick J. Parsons, Ph.D.

Chief, Laboratory of Inorganic and Nuclear Chemistry

Deputy Director, Division of Environmental Health

Mary Frances Verostek, Ph.D.

**Assistant Section Head** 

PT Program for Blood Lead /Trace Elements

# New York State Department of Health Event #1, 2013

#### **Urine Arsenic**

The source of the test materials is human urine obtained from donor volunteers with informed consent. Urine was collected into polyethylene containers and then stored at 4°C. Following collection, urine from each donor was mixed and acidified to 1% v/v with nitric acid, and 1% (v/v) sulfamic acid solution containing 200 mg/mL sulfamic acid and 10% (v/v) Triton-X 100 was added to stabilize Hg. The urine was stored frozen at -80°C; after thawing at room temperature, precipitated salts were removed by centrifugation. The urine was separated into five pools and each was supplemented with different amounts of inorganic As³+. Each pool was stirred for approximately 24 hours to ensure thorough mixing prior to aliquoting 10-mL samples into acid-leached polypropylene vials. Samples were stored at -80°C prior to circulating for proficiency testing.

The Target Value assigned for each PT material is the robust mean of the results reported by all participants in this event. The robust statistics were obtained utilizing algorithms based on those presented in ISO 13528:2005E Statistical methods for use in proficiency testing by interlaboratory comparisons. Values for urine arsenic range from 16.9  $\mu$ g/L (0.23  $\mu$ mol/L) to 295.3  $\mu$ g/L (3.94  $\mu$ mol/L).

**Acceptable ranges.** The acceptable range is fixed at  $\pm 20\%$  or  $\pm 6~\mu g/L$  for target values  $\leq 30~\mu g/L$ . This provides a more realistic acceptability range at low concentrations of urine As, and the criteria are consistent with those in place for blood As.

**Discussion.** Based upon the above criteria, 100.0% of test results reported were judged as satisfactory, with none of the 24 participant laboratories reporting 2 or more of the 5 results outside the acceptable ranges.

#### **Urine Cadmium**

The source of the test materials is human urine obtained from donor volunteers with informed consent. Urine was collected into polyethylene containers and then stored at 4°C. Following collection, urine from each donor was mixed and acidified to 1% v/v with nitric acid, and 1% (v/v) sulfamic acid solution containing 200 mg/mL sulfamic acid and 10% (v/v) Triton-X 100 was added to stabilize Hg. The urine was stored frozen at -80°C; after thawing at room temperature, precipitated salts were removed by centrifugation. The urine was separated into five pools and each was supplemented with different amounts of inorganic Cd²+. Each pool was stirred for approximately 24 hours to ensure thorough mixing prior to aliquoting 10-mL samples into acid-leached polypropylene vials. Samples were stored at -80°C prior to circulating for proficiency testing.

The Target Value assigned for each PT material is the robust mean of the results reported by all participants in this event. The robust statistics were obtained utilizing algorithms based on those presented in ISO 13528:2005E Statistical methods for use in proficiency testing by interlaboratory comparisons. Values for urine cadmium range from 1.3 μg/L (12 nmol/L) to 14.0 μg/L (125 nmol/L).

Acceptable ranges. The acceptable range is fixed at  $\pm 15\%$  or  $\pm 1~\mu g/L$  (9 nmol/L) around the target value whichever is greater. These criteria are used by the U.S. Occupational Safety and Health Administration (OSHA) to assess performance for occupational medicine.

**Discussion.** Based upon the above criteria, 97.5% of test results reported were judged as satisfactory, with one of the 24 participant laboratories (4.2%) reporting 2 or more of the 5 results outside the acceptable ranges.

#### **Urine Mercury**

The source of the test materials is human urine obtained from donor volunteers with informed consent. Urine was collected into polyethylene containers and then stored at 4°C. Following collection, urine from each donor was mixed and acidified to 1% v/v with nitric acid, and 1% (v/v) sulfamic acid solution containing 200 mg/mL sulfamic acid and 10% (v/v) Triton-X 100 was added to stabilize Hg. The urine was stored frozen at -80°C; after thawing at room temperature, precipitated salts were removed by centrifugation. The urine was separated into five pools and each was supplemented with different amounts of inorganic Hg. Each pool was stirred for approximately 24 hours to ensure thorough mixing prior to aliquoting 10-mL samples into acid-leached polypropylene vials. Samples were stored at -80°C prior to circulating for proficiency testing.

The Target Value assigned for each PT material is the robust mean of the results reported by all participants in this event. The robust statistics were obtained utilizing algorithms based on those presented in ISO 13528:2005E Statistical methods for use in proficiency testing by interlaboratory comparisons. Values for urine mercury range from 11.1  $\mu$ g/L (55 nmol/L) to 70.5  $\mu$ g/L (351 nmol/L).

**Acceptable ranges.** The acceptable range is fixed at  $\pm 30\%$  or  $\pm 3 \mu g/L$  (15 nmol/L) for target values  $\leq 10 \mu g/L$ . The criteria are consistent with those in place for blood Hg.

**Discussion.** Based upon the above criteria, 94.5% of test results reported were judged as satisfactory, with two of the 22 participant laboratories (9.1%) reporting 2 or more of the 5 results outside the acceptable ranges.

#### **Urine Lead**

The source of the test materials is human urine obtained from donor volunteers with informed consent. Urine was collected into polyethylene containers and then stored at 4°C. Following collection, urine from each donor was mixed and acidified to 1% v/v with nitric acid, and 1% (v/v) sulfamic acid solution containing 200 mg/mL sulfamic acid and 10% (v/v) Triton-X 100 was added to stabilize Hg. The urine was stored frozen at -80°C; after thawing at room temperature, precipitated salts were removed by centrifugation. The urine was separated into five pools and each was supplemented with different amounts of inorganic Pb<sup>2+</sup>. Each pool was stirred for approximately 24 hours to ensure thorough mixing prior to aliquoting 10-mL samples into acid-leached polypropylene vials. Samples were stored at -80°C prior to circulating for proficiency testing.

The Target Value assigned for each PT material is the robust mean of the results reported by all participants in this event. The robust statistics were obtained utilizing algorithms based on those presented in ISO 13528:2005E Statistical methods for use in proficiency testing by interlaboratory comparisons. Values for urine lead range from 14.4  $\mu$ g/L (0.07  $\mu$ mol/L) to 222.7  $\mu$ g/L (1.07  $\mu$ mol/L).

**Acceptable ranges.** The acceptable range is fixed at  $\pm 10\%$  or  $\pm 40~\mu g/L$  (0.19  $\mu mol/L$ ) around the target value, whichever is greater. These criteria are consistent with those established under CLIA '88 (Federal Register Volume 57, Number 40, §§ 493.2 and 493.937, February 28, 1992) for blood lead.

**Discussion.** Based upon the above criteria, 99.1% of test results were judged as satisfactory, with none of the 22 participant laboratories reporting 2 or more of the 5 results outside the acceptable ranges.

# New York State Department of Health Event #1, 2013

#### **Additional Trace Elements Reported in Urine**

Participating laboratories reported analytical results for any other elements that are routinely reported in order to characterize these materials more completely. Results and descriptive statistics are provided for reference purposes. No target value or acceptable range is implied. As, Cd, and Pb were spiked using a stock standard containing all elements in the National Health and Nutrition Examination Survey (NHANES) conducted by the Centers for Disease Control and Prevention. Refer to <a href="https://www.cdc.gov/exposurereport">www.cdc.gov/exposurereport</a> for more information on recent NHANES data for these elements in urine. In addition, these samples were spiked with leading elements present in other proficiency testing programs. The following table shows the additional elements spiked in the samples.

NHANES Elements	Additional Elements

# New York State Department of Health Trace Elements in Urine METHOD NOTES

#### ATOMIC SPECTROMETRY METHODS

- A-1 ETAAS-Z (Electrothermal atomic absorption spectrometry with Zeeman background correction)
- A-2 ETAAS other (i.e., D<sub>2</sub>, S-H background correction)
- A-3 FAAS (Flame atomic absorption spectrometry)
- A-4 CV-AAS (Cold vapor atomic absorption spectrometry)
- A-5 HG-AAS (Hydride generation atomic absorption spectrometry)
- A-6 AFS (Atomic fluorescence spectrometry)
- A-7 Other

#### INDUCTIVELY COUPLED PLASMA

- P-1 ICP-MS (Inductively coupled plasma mass spectrometry)
- P-2 DRC/CC-ICP-MS (ICP-MS used in the Dynamic Reaction Cell or Collision Cell mode)
- P-3 ICP-AES/OES (ICP atomic/optical emission spectrometry)
- P-4 HR-ICP-MS (High resolution ICP-MS)
- P-5 ETV-ICP-MS (Electrothermal vaporization ICP-MS)
- P-6 ID-ICP-MS (Isotope dilution ICP-MS)
- P-7 Other

#### **ELECTROCHEMICAL METHODS**

- E-1 ASV (Anodic stripping voltammetry without digestion)
- E-2 ASV-LeadCare® (Anodic stripping voltammetry using the ESA LeadCare® system)
- E-3 Fluoride specific electrode
- E-4 Other

#### MOLECULAR FLUORIMETRY

- F-1 EtOAc (Ethyl acetate-acetic acid extraction method for determination of erythrocyte protoporphyrin)
- F-2 Aviv hematofluorometry (for determination of EP at hematocrit 35)
- F-3 Helena ZPP (for determination of zinc protoporphyrin in  $\mu$ mol ZPP/mol heme)
- F-4 Other

#### **OTHER METHODS**

If your method is not listed in the above list, please describe it briefly.
